

# SUPER Screenshot

## How to use

1. Open editor window by going to **Window > Super Screenshot**

2. Click **Capture Screenshot**

## Transparency with Post Processing and HDRP

Transparency is calculated by rendering the image with both a black background and a white background, then calculating the amount of change between the two renders for each pixel. If any post processing effects modify the background in any way, that can affect the calculation and produce incorrect transparency.

By default, HDRP has Color Grading enabled. When Color Grading is enabled and you capture a screenshot with transparency, the background is not going to be fully transparent. To fix this, disable Color Grading in the custom frame settings of the camera.
